Redstage Networks

Magento Extension – Add Product Video – FREE! – v1.0

Extension Summary

This extension allows you to easily add videos to your product pages!

One of the biggest trends on the internet in the past 5 years is the utilization of video to sell products online. If you need to add a video to your product pages, this extension will help!

With just a two-minute installation, you can quickly start adding video to a section of your product page. The extension offers 4 different product page locations out of the box that the video code will be inserted.

Four Product Video Inclusion Areas

- Include the video beneath the additional information section
- Include the video after the short review section (or "be the first to leave a review...")
- Include the video below the tags area on the product page
- Include the video after the add to cart button

Using the extension is super easy!

All you need to do after uploading the files is enable one of the sections on the product page where you want the extension to show up.

Then, navigate to the product you want to add a video to and you'll find a new **Product Video** section.

Just paste in your embed code from Youtube, Vimeo, or any of your favorite video sites and just like that, you can add the video to your product page!

Installation Notes

1. Backup, Backup, Backup - Prior to installation, make sure you backup your store database and web directory. In fact, you should remember to backup your store regularly if you're not doing so already.

2. If you are using the Magento Compiler, be sure to disable it prior to installing this (or any) extension. You must recompile once complete.

3. Download and Extract - Download and unzip **"module-code.zip"** on your computer and navigate inside the extracted folder. The folder structure is preserved within in the archive file. You need

to simply need to upload the app, skin, etc directories included right to your Magento root directory (the directory with app, downloader, error, etc …etc).

a. !!Wait!! Are you using a different theme from the default? *If applicable*, rename folders app/design/frontend/default/default and skin/frontend/default/default to your store's values. If those files don't exist in this extension, ignore this warning.

b. Note! For versions of Magento without "app/design/frontend/base" or if you have a custom implementation, simply substitute "base > default" with "your package > your theme".

4. On a Linux system, you will need to **chmod** all these files such that they have appropriate permissions – the exact permission vary based on your server setup.

a. First try the same permissions that most of your Magento *.php files are set to

b. If that fails, you may have to resort to using 0755 or even 0777.

5. Refresh the Magento cache either

a. Through the Admin Panel, at **System > Cache Management**

b. By deleting the contents of **[magento-dir]/var/cache**

6. Verify the module is enabled and installed. Within the Magneto Admin Panel, navigate to **System > Configuration > Advanced** and expand the contents of "Disabled modules output". You should see an entry for "Redstage_ Youtubevideo" set to "Enable".

| Phoenix_Moneybookers | Enable |
| Redstage_Youtubevideo | Enable |
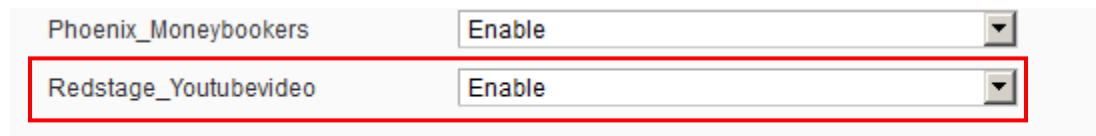

User Guide

Take a look at the various options that this extension has and their explanations below.

There are 4 sections of the product page that you can show your product video. If your store is following the normal theme structure, this is where the videos will show up.

You can enable and disable the settings quickly and easily to see how they will work with your theme.

By default, these will all be set to No, so you have to turn one on before seeing any videos on your product pages.

Redstage Product Video Settings

Redstage Product Video Settings		
Enabled Video Below of Additional Info	Yes	[STORE VIEW]
Enabled Video After Short Review Block	No	[STORE VIEW]
Enabled Video Below of Tag	No	[STORE VIEW]
Enabled Video After Add to Cart	No	[STORE VIEW]

**The Below Additional Info Option will show up here:**

**Under the short review block will display here:**
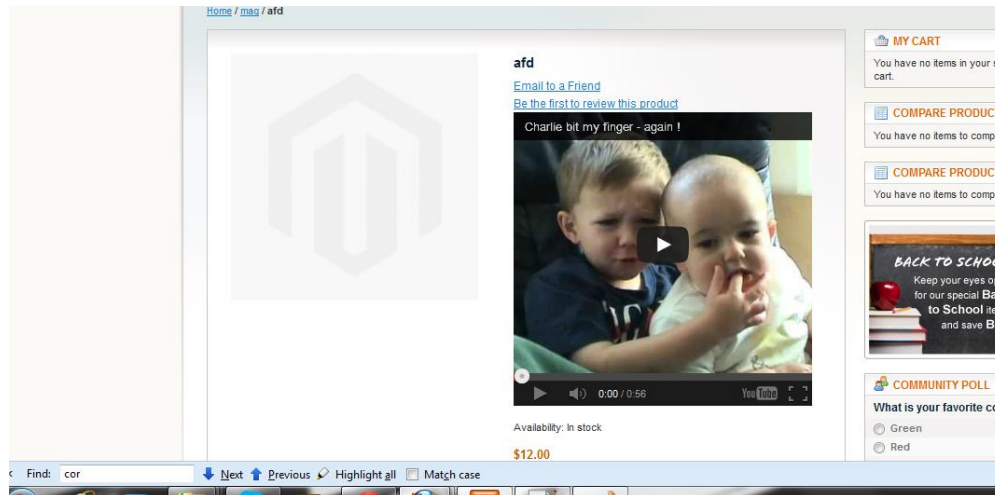

Under the tags section shows the video here:
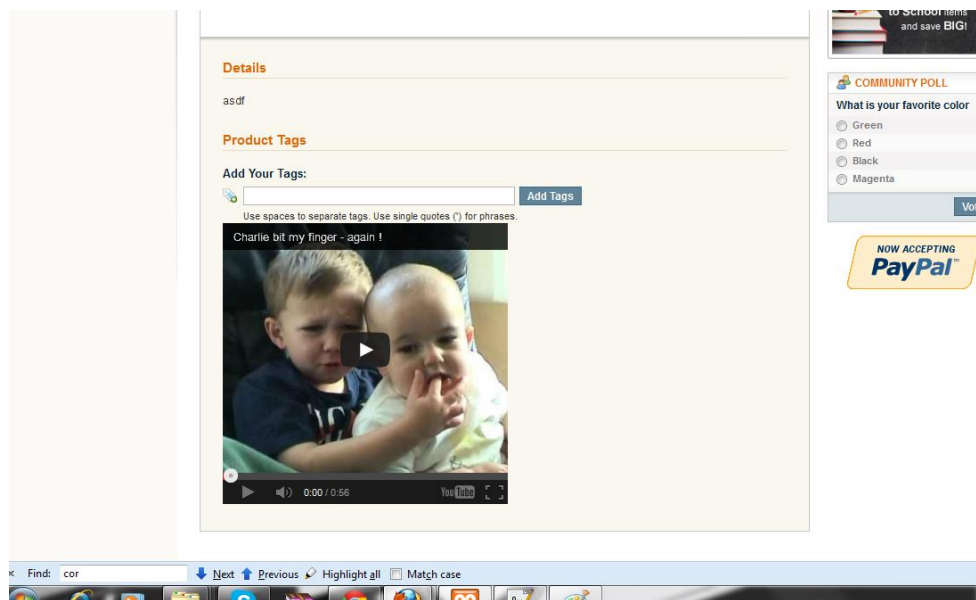

Under the add to cart button will show the video here:

Since you're simply adding the entire embed script to the product, you can control the size of the video from there.

The video will show up inside a div with the class "video-views" . You can use this class to update the style of the video container, adding borders, padding, background colors, etc… So, if you wanted a bit of space around the video you can add this CSS to your site:

.video-views{padding:5px;margin-top:10px;}

Custom Video Inclusion

If these default locations don't work for you, you can input the code into the product view file directly where you need it to show up.

First, make sure that you turn off the other settings so they are all set to No.

You will want to make this change in your extended theme and not in the base theme directory.

The path will be app/design/frontend/*your-package*/*your-theme*/catalog/product/view.phtml

Now, put the following code where you want the video to show up:

```
if($_product->getYoutubecode())

{

echo "<div class='video-views'>".$_product->getYoutubecode()."</div>";

}
```

This way, you can put the video into a lightbox, as a part of your gallery or anywhere else you want it to show up.

Troubleshooting

Problem: I get an error after installation, a blank screen, or Magento wants to start the installation procedure.
Solution: Set the permissions on the new files to 755 on the server using chmod. Check to make sure that the files are owned by the web server user (not a user like root). Clear the cache.

Most other errors will be solved by clearing the store cache and cookies. If you have any other problems, please contact us.
